JOB MARKET PAPER

1. [Incentive Misalignment and Market Efficiency: Evidence from Portfolio Manager Ownership in the Mutual Fund Industry](#)

Abstract: This paper examines the impact of agency-issue-induced incentive misalignment on the risk-return relation in the stock market. Using hand-collected data on portfolio manager ownership of U.S. active mutual funds, I construct a stock-level measure of exposure to incentives-induced trading and show that this measure is associated with the abnormally low returns of high-risk stocks. Across a comprehensive set of strategies that buy high-risk stocks and sell low-risk stocks, negative alphas concentrate only among stocks subject to high incentives-induced trading. This finding is consistent with the conjecture that incentives-induced trading entails excessive risk taking that distorts the risk-return relation. This pattern is not driven by other firm characteristics and does not extend to other groups of anomaly strategies. Overall, the paper highlights the role of incentive alignment mechanisms in improving market efficiency.

WORKING PAPERS¹

2. [Flow Hedging and Mutual Fund Performance](#)

Abstract: This paper studies hedging behavior of active mutual funds against flow volatility and its implications for fund performance. Recent evidence suggests that shocks to the common component of fund flows are a priced risk factor in expected stock returns. I find

¹† indicates presentation by co-author.

that nearly half of U.S. active equity funds tilt their portfolios toward stocks with higher exposure to common flows, suggesting that many funds do not hedge against flow risk. A model in which informed managers receive more precise private signals about common flows provides an explanation for this behavior. Using managers' portfolio tilt as a proxy for ability, I confirm the model's main prediction that funds having higher exposure to common flows generate better risk-adjusted performance. These funds also attract higher future flows.

3. **Out-of-Sample Performance of Factor Return Predictors**

Abstract: In a factor timing context, recent studies have emphasized on developing techniques that reduce the factor dimension and demonstrated return predictability using only a few predictors with specific choice of estimation design. This focus inadvertently neglects the crucial issue of model instability that has been shown to plague the forecasting literature. Using almost a hundred equity factors and a broader set of predictor variables, I find that the forecasting performance of recent factor timing techniques is indeed sensitive to the choice of empirical design. Applying a variety of shrinkage methods on predictors and focusing on forecasting individual factors to better capture the dynamics between factor returns and predictive signals, I document robust evidence of out-of-sample predictability and more stable investment performance for factor timing strategies. The optimal timing portfolio has a 30% higher Sharpe ratio and generates more than twice the economic gains relative to the factor dimension-reduction approach.

4. **The Up Side of Being Down: Depression and Crowdsourced Forecasts**

with [Sima Jannati](#) and [Sarah Khalaf](#)

Abstract: We examine the impact of non-severe depression on crowdsourced financial judgments using earnings forecasts from Estimote. Our findings reveal that an increase in the proportion of the U.S. population with depression is associated with improved forecast accuracy among users. This effect remains consistent across different measures and is distinct from the influence of temporary seasonal depression or other sentiment measures on decision-making. We identify two mechanisms, namely slow information processing and reduced optimism, that contribute to explaining our results. Overall, our research establishes a link between depression and crowdsourced financial evaluations.
